

① $t_a = |t_{ab}|$, fixed model: $f(1-f)$, $x_\beta = 2x_\alpha$, $q=1$, $\eta=1$.

Ⓐ $V=2$:

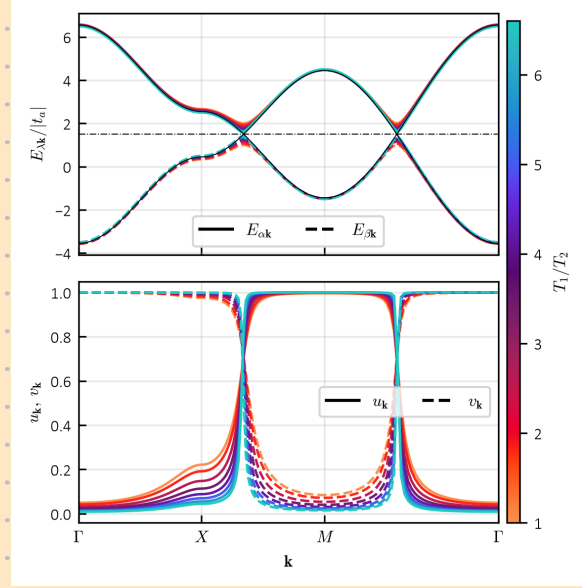

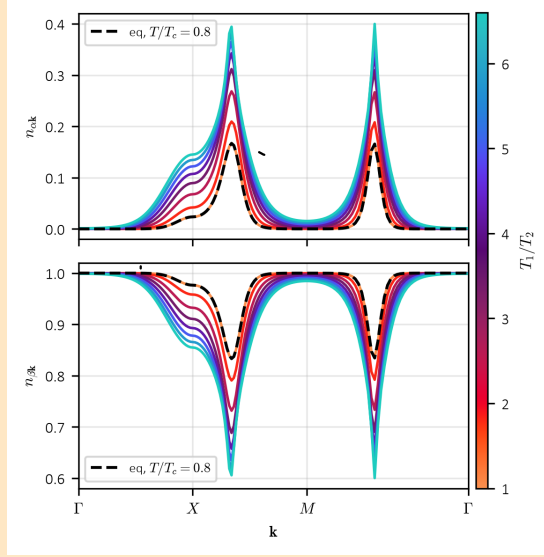

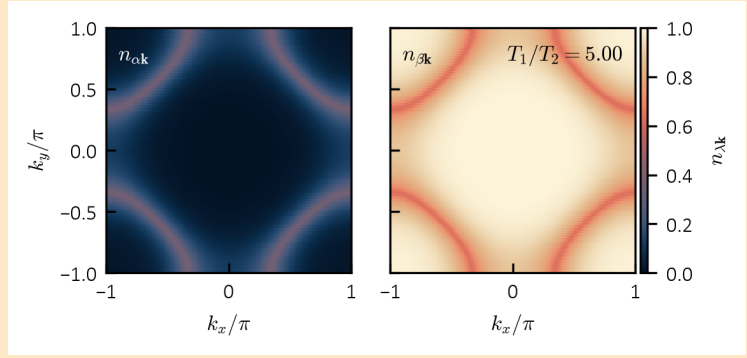

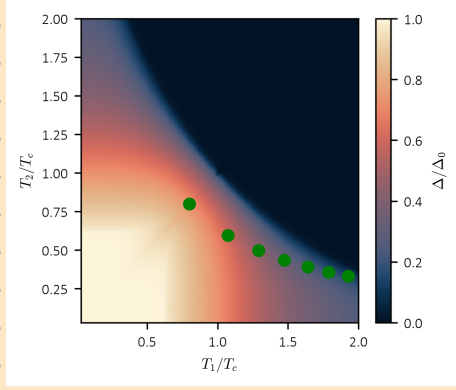

Ⓑ $V=5$ (n max Δ pin ke pegerih):

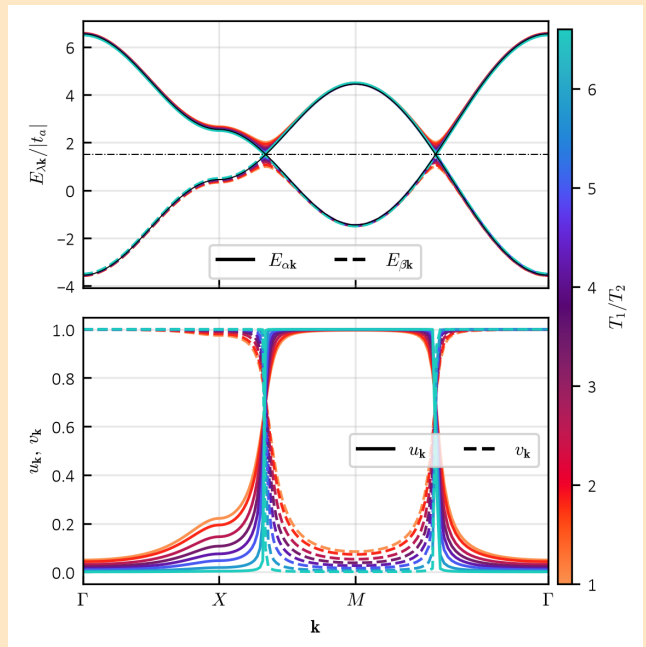

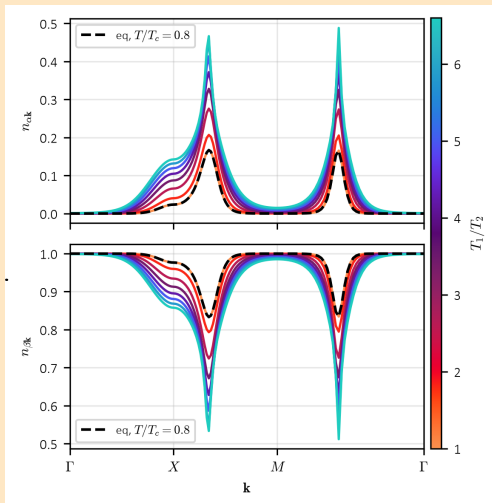

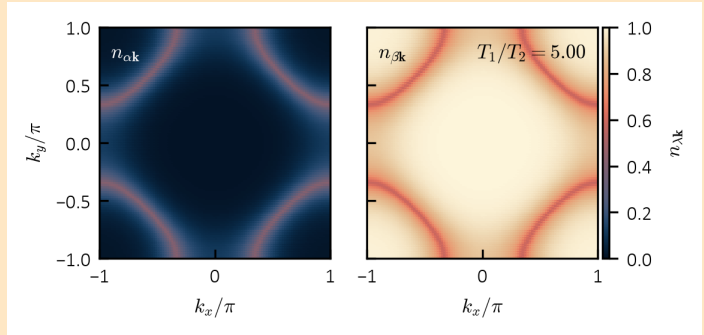

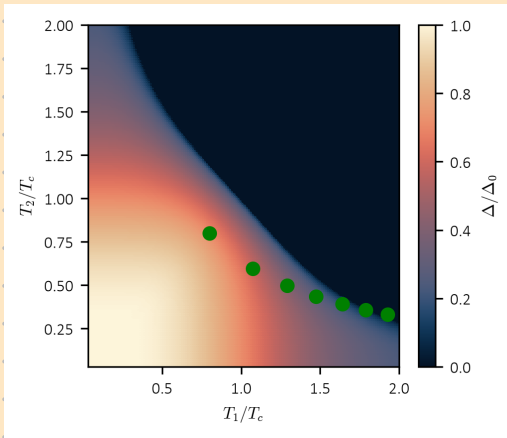

① $V=3$ fixed: kernel ratios:

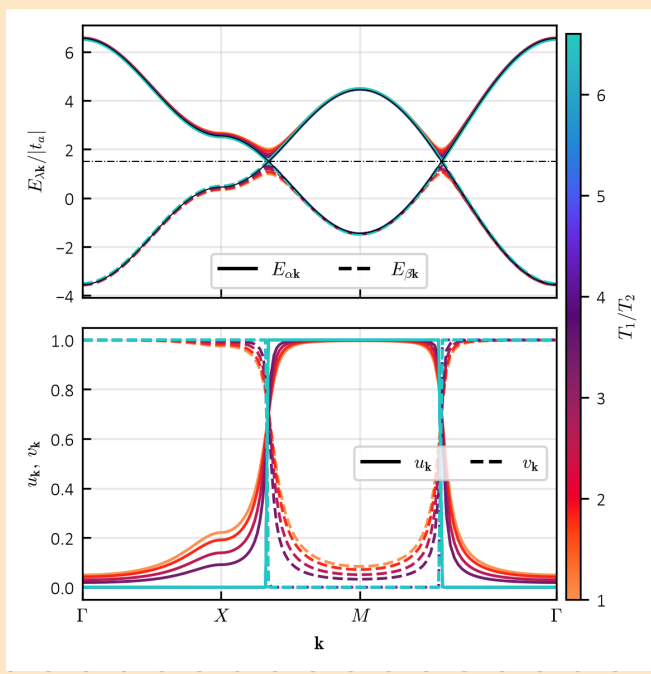

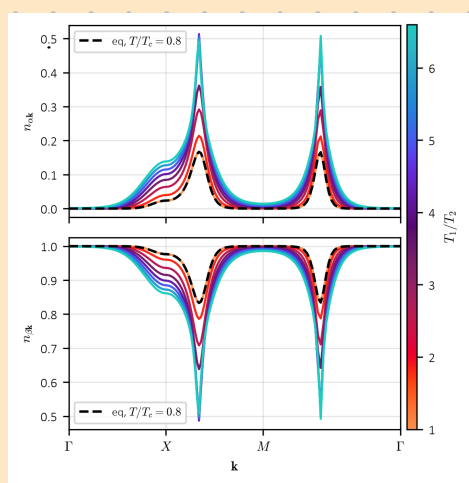

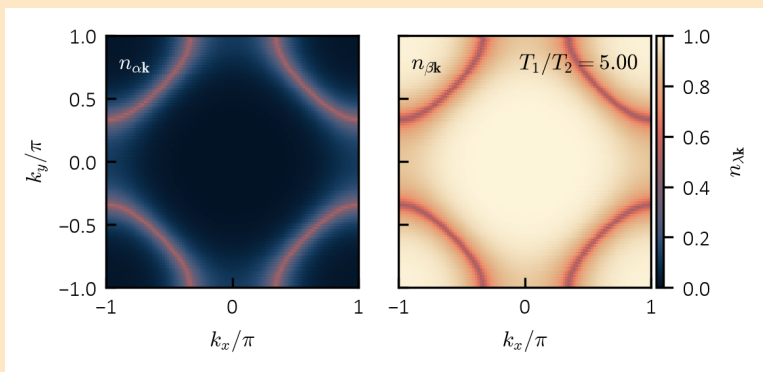

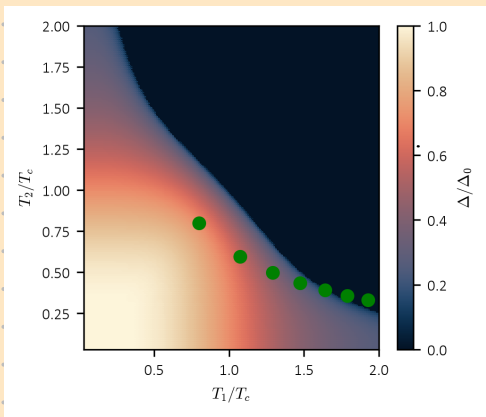

(A) $\kappa_{\alpha\beta} = 2\kappa_{\alpha\alpha}$:

② $\kappa_{\alpha\alpha} = \kappa_{\alpha\beta}$

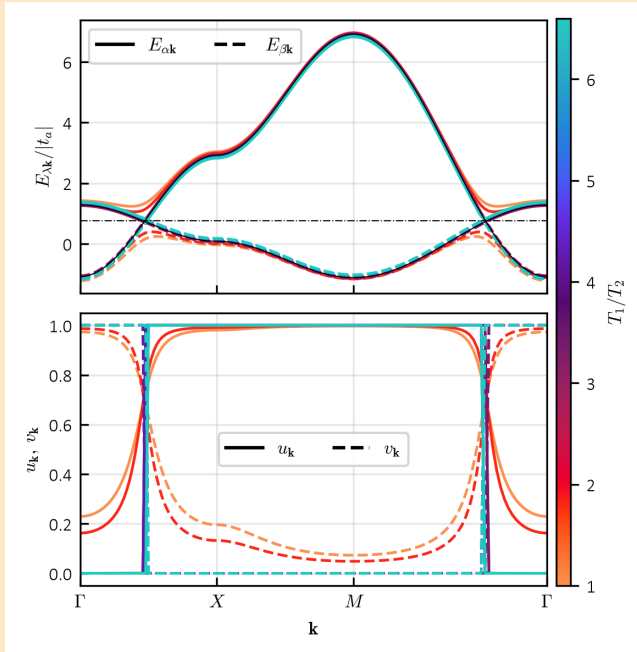

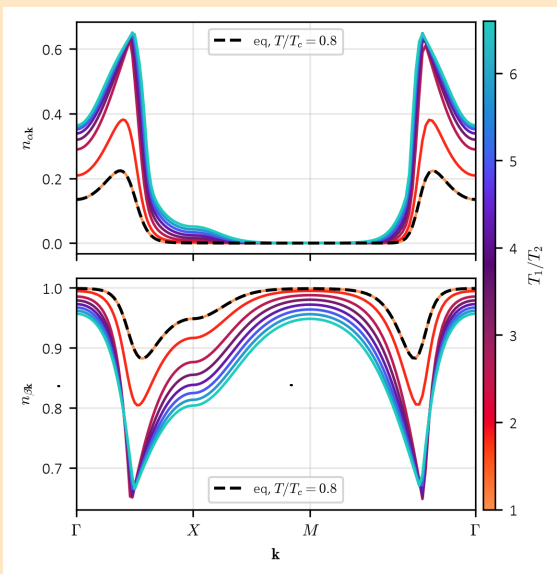

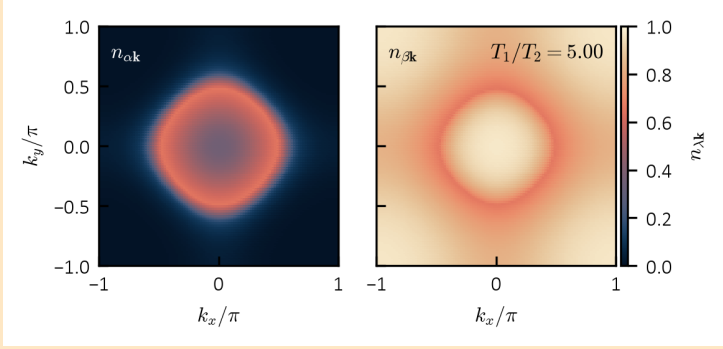

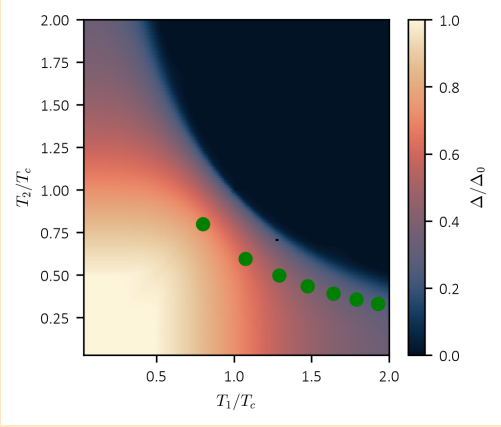

(c) $\chi_{\alpha\alpha} = 2\chi_{\alpha\beta}$

(3) $t_a \neq t_b$

(A) $\chi_{\alpha\beta}/t_a = -0.3$

③) $t_D/t_a = -0.6$
